

Logging System

ESKA® Logging is a web-based system which automates the documenting and logging process on the application level into a separate dedicated server securely.

ESKA Logging provides tracking of every interaction with any web-based .NET application from login to logout, providing investigators and auditors with the ability to collect information about the behaviour of the application-user. The application-user who made the changes and every single application interaction can be viewed through a rich and scalable user-interface.

Key Features

- Cross-platform and responsive (desktop, mobile, tablet).
- NoSQL architecture for high performance and scalability.
- Dashboard with customizable graphical summaries.
- Real-time online users monitoring.
- Unsuccessful logon tracking.
- Login history tracking.
- Business events monitoring.
- Errors and exceptions tracking.
- Advanced logging query and search.
- User preferences and settings.
